

BHAVANI SANKAR NAVEEN DWARAPUDI

React.js Developer | React Native Developer | Full-Stack (MERN) Engineer

Andhra Pradesh, India | dbsnaveen@gmail.com | +91 8186879491 | linkedin.com/in/dbsnaveen

PROFESSIONAL SUMMARY

React.js and React Native developer with 4+ years shipping 5 production applications — three enterprise web portals and two cross-platform mobile apps — as client engagements spanning pharmaceutical, fintech, logistics, and healthcare organizations, including Dr. Reddy's and Amazon. Led the Ionic-to-React-Native migration of Amazon's internal warehouse applications to native-performance Android and iOS builds. Designed the RBAC and authentication layer, including Google OAuth, securing three enterprise portals on a pharmaceutical B2B platform. Introduced an AI-assisted development workflow (GitHub Copilot) that cut reusable-component build time by over 30% and was adopted across three project teams. Now extending into full-stack ownership with Node.js, Express.js, and MongoDB, including an independently designed, built, and deployed MERN application.

CORE SKILLS

Frontend Development: React.js, Next.js, React Native, TypeScript, JavaScript (ES6+), Redux Toolkit, RTK Query, Context API, HTML5, CSS3, Bootstrap, Material-UI (MUI)

Backend & APIs: Node.js, Express.js, REST API Design & Integration, JWT Authentication

Databases: MongoDB, MySQL, PostgreSQL

Testing: Jest, React Testing Library, Vitest

Mobile Development: React Native, Android Studio, Xcode, multi-environment builds (dev/staging/prod)

Cloud & DevOps: AWS, CI/CD build pipelines, Git, GitHub, Bitbucket, Azure DevOps (Boards & Repos)

Monitoring & Analytics: Firebase, CleverTap, New Relic

Project Tools: JIRA, Postman, Strapi CMS

AI-Assisted Development: GitHub Copilot, Claude — component generation & code review (30%+ measured build-time reduction)

PROFESSIONAL EXPERIENCE

Software Engineer — Aziro Technologies Pvt. Ltd.

June 2022 – Present

AI-Native Product Engineering Company | Chennai, India

Client Engagement: Dr. Reddy's Laboratories — XCEED API

Admin, Internal SPOC & Customer Portals (Pharmaceutical B2B Platform) | React.js, TypeScript, Material-UI, Redux Toolkit, Node.js, Express.js, AWS, MySQL

- Rebuilt three existing enterprise portals (Admin, Internal SPOC, Customer) on a new technology stack, redesigning the UI and expanding functionality to modernize Dr. Reddy's B2B ordering system for its distributor network.
- Architected a two-tier RBAC and authentication model (super admin / limited admin) enforced across all three portals to prevent unauthorized cross-role data access.
- Owned the Redux Toolkit state architecture for multi-role workflows, keeping shared state consistent across the Admin, SPOC, and Customer portals as usage scaled.
- Shipped a JSON-driven multilingual layer so new languages could be added through configuration alone, with no code changes required.
- Introduced an AI-assisted development workflow pairing GitHub Copilot with a shared component library, reducing reusable-component build time by over 30% — the largest efficiency gain on the project.
- Delivered the full three-portal platform on schedule across every Agile sprint and QA cycle, with zero missed production releases.
- Integrated REST APIs with the Node.js/Express.js backend team to power live B2B ordering and customer onboarding.

Client Engagement: Nuvei — Bill Pay

Admin Portal & Citizen Portal (Municipal Bill Payment Platform) | React.js, TypeScript, Material-UI, Context API, Node.js, MySQL, Strapi CMS, Azure DevOps Boards

- Built two responsive single-page applications (Admin, Citizen) with Context API-based authentication, giving municipal staff and residents one platform to manage and pay bills online.
- Integrated Strapi CMS so non-technical municipal staff could publish content updates directly, removing engineering from the content-update loop.
- Developed a reusable, modular UI component set shared across both portals to speed up new-screen development.
- Managed source control across Bitbucket and Azure DevOps Repos, and ran sprint tracking through JIRA and Azure DevOps Boards.
- Supported every QA cycle and production deployment without a rollback incident.

Client Engagement: Internal Capability Hub (ICH)

- Set up the project from the ground up — protected routing, environment configuration, and deployment pipeline — ahead of any feature development.
- Implemented RBAC with Google OAuth, letting employees sign in with existing company credentials instead of a separate login system.
- Integrated REST APIs to automate internal workflow steps that had previously been tracked manually.
- Owned the portal end-to-end, from initial setup through production deployment.

Client Engagement: Amazon — WoW & AMS Internal Warehouse Mobile Applications

React Native, TypeScript, Redux Toolkit, RTK Query, Firebase, Node.js

- Led the migration of Amazon's internal warehouse applications from Ionic to React Native, shipping native-performance Android and iOS builds to replace the legacy hybrid stack.
- Integrated QR/barcode scanning into core warehouse workflows, replacing manual data lookups with a single scan.
- Applied memoization (React.memo, useMemo, useCallback) across high-traffic screens to reduce unnecessary re-renders and keep the app responsive under warehouse-floor usage.
- Set up Firebase, CleverTap, and New Relic for real-time crash, usage, and performance monitoring.
- Configured separate dev/staging/production build and CI/CD pipelines to support warehouse-floor releases without manual environment switching.

Emami Frankross Health

Healthcare E-Commerce Mobile App | React Native, JavaScript, Firebase, Redux, Ruby on Rails

- Built the cross-platform mobile UI powering product discovery and ordering, from browse through checkout, for a healthcare e-commerce app.
- Integrated REST APIs for product catalog, authentication, and order management against a Ruby on Rails backend.
- Built a reusable UI component set and worked directly with QA to resolve stability and UX issues before release.

INDEPENDENT PROJECT

Support Ticket Management System — Full-Stack MERN Application

React.js, TypeScript, Redux Toolkit, RTK Query, Node.js, Express.js, MongoDB

- Designed and built a full-stack ticketing platform covering the entire lifecycle — creation, assignment, tracking, escalation, and resolution.
- Implemented JWT-based authentication and role-based authorization across Admin and User access tiers.
- Built the REST API layer in Node.js/Express.js and modeled data in MongoDB with Mongoose.
- Built the React.js frontend with Redux Toolkit and RTK Query for centralized state management and data fetching.
- Deployed the frontend to Vercel and backend to Render as a live, publicly accessible application.

KEY ACHIEVEMENTS

- Delivered 5 production applications (3 enterprise web portals, 2 cross-platform mobile apps) across pharmaceutical, fintech, logistics, and healthcare client engagements, from architecture through production support.
- Reduced component development time by over 30% by introducing an AI-assisted (GitHub Copilot) workflow later adopted as the template across multiple project teams.
- Independently led the full Ionic-to-React-Native migration of Amazon's internal warehouse applications, owning the Android/iOS rebuild end-to-end.
- Designed and shipped RBAC and authentication, including Google OAuth, securing three-plus enterprise portals from day one of each build.
- Built a full-stack application independently (React.js, Node.js, Express.js, MongoDB) to demonstrate full-stack ownership beyond frontend-only delivery.

CERTIFICATIONS & CONTINUOUS LEARNING

- Frontend Developer (React) — HackerRank
- JavaScript (Intermediate) — HackerRank
- Node (Basic) — HackerRank
- Full-Stack Web Development with MERN & PERN Stacks — Udemy
- React Testing Library with Jest / Vitest — Udemy
- The Complete React Native + Hooks Course — Udemy

EDUCATION

B.Tech — Electronics and Communication Engineering

Ramachandra College of Engineering, Eluru

2019
